

Turf Insect Pest Survey 2004

K. Umeda and G. Towers

University of Arizona

Cooperative Extension

Introduction

- Phoenix: unique climate, environment
 - Limited insect pest knowledge
 - Taxonomy
 - Generations/season
 - Timing of emergence/occurrence
 - Control strategies
 - Economic thresholds

Materials and Methods

Network of blacklight traps around valley

Materials and Methods

Network of blacklight traps around valley

Collection Results

- Pests
 - Moths
 - Sod Webworm
 - Armyworm, Cutworm
 - Beetles (white grub complex)
 - Masked Chafers
 - BTAtaenius (and Aphodius)

Key Pests – BTA

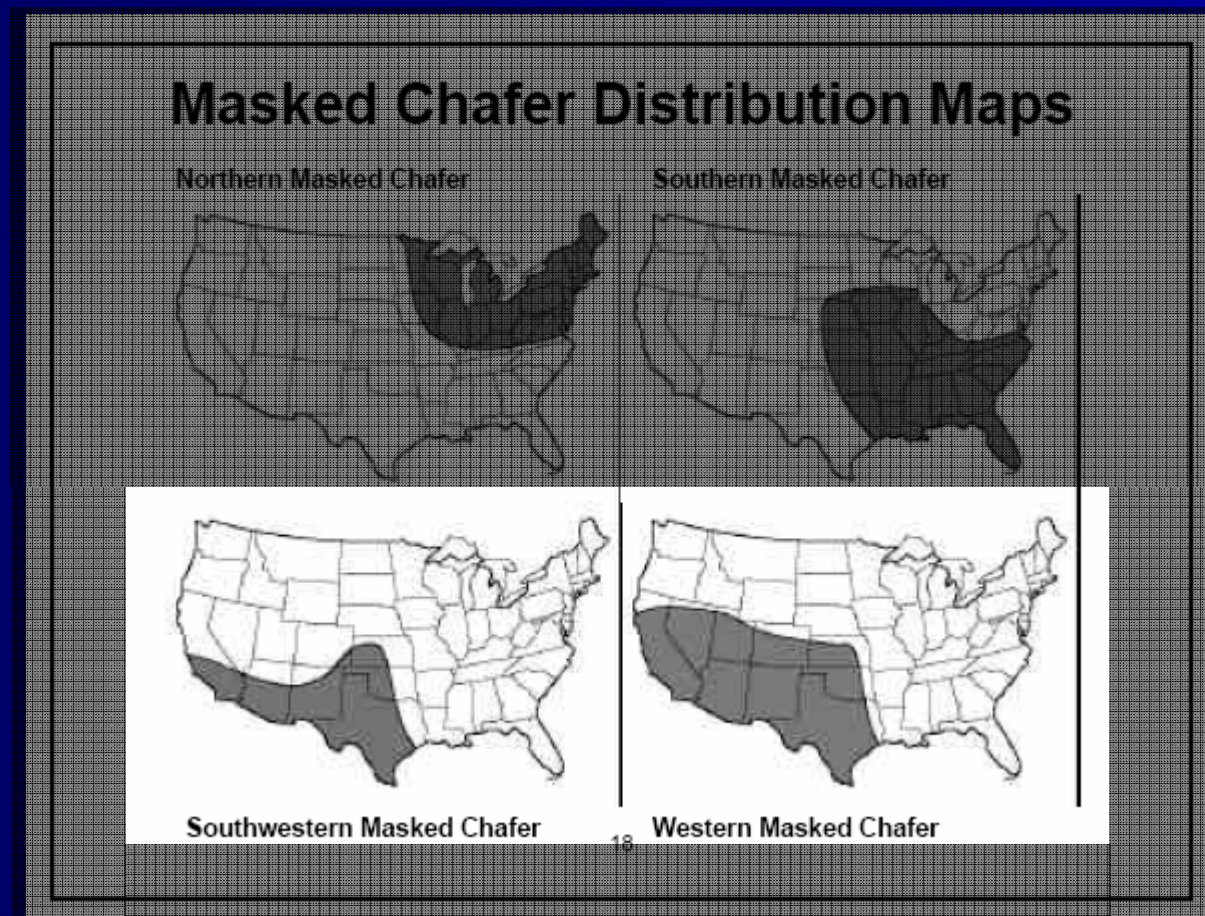

BTA adults have a smooth hind tibia while *Aphodius* has three spurs.

Key Pests – Chafer Beetles

Part of the White grub complex

Key Pests – Chafer Beetles

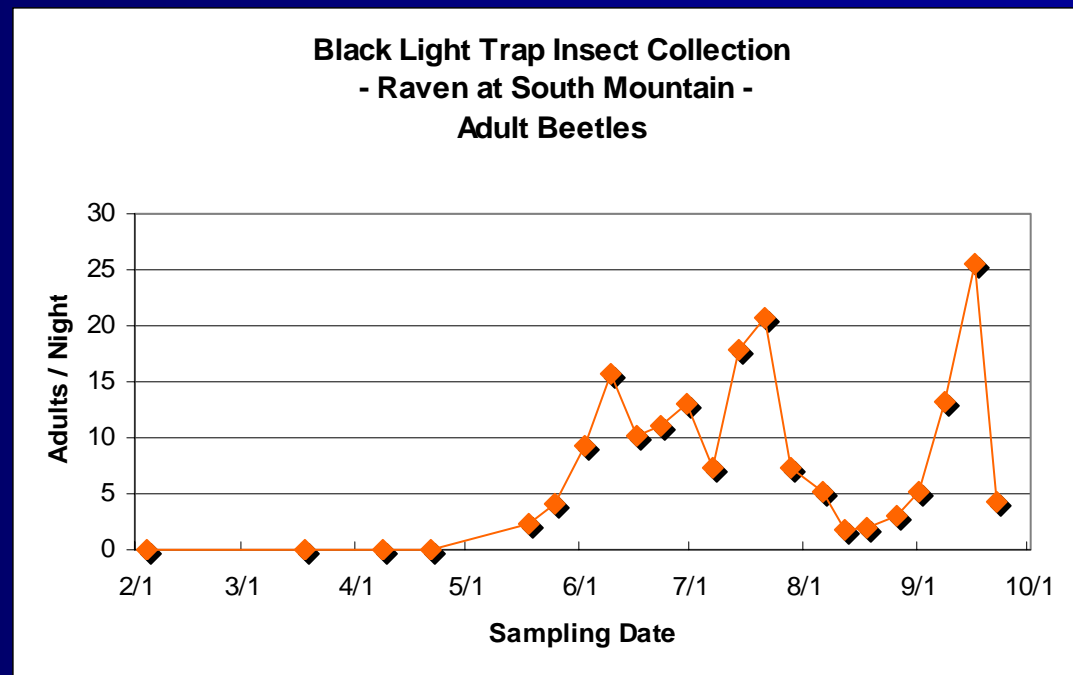

Key Pests – Chafer Beetles

Monitoring

How?

Monitoring

How?

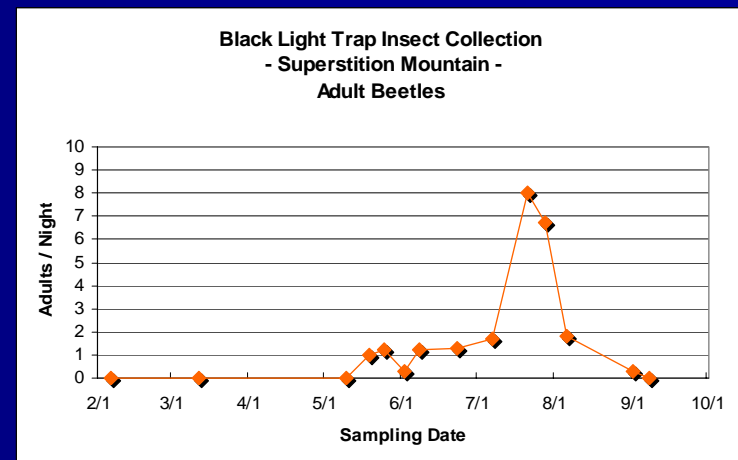

Monitoring

How?

Where?

- Sites with a history of grub damage
- Geographic area to a lesser extent

Monitoring

How?

Where?

When?

- Adults – PM, May thru October
- Grubs – 3 weeks after peak emergence

Monitoring

How?

Where?

When?

Why?

- ID - friend or foe?
- Informed decisions on control
- Save \$ and protect turf

Summary

- Masked chafer appears primary grub
- 2,3 individual populations of chafers
- Each population active at diff. times
- Conventional trt regimes unacceptable?
- Monitoring = INFO
= effective control for YOU

PHX is a unique environment in every way
